SEVA FIRST INNOVATION CHALLENGE 2026 · EASTERN REGION · THEME: EMPLOYMENT, LIVELIHOOD & MSMEs

RozgarSetu AI

The trust layer for job seekers

Innovation & Implementation Plan

Know which jobs fit you, why you fit, what is missing, and what to do next.

Theme	Employment, Livelihood & MSMEs
Category	Junior (Eastern Zone: school, ITI and polytechnic students and undergraduates)
Pilot area	Selected communities in West Bengal: [FILL IN: block / town / district]
Applicant / team	Somnath Pal (lead applicant); other team members listed under About the Team
Application number	[FILL IN: generated by the portal after submission]

Status of this document. This is a plan for a prototype and pilot. Unless separately demonstrated and documented, no live integrations, confirmed partnerships, active user base, verified vacancy count or employment outcomes are claimed. Budget, targets and schedule are planning estimates to validate before implementation.

Summary

RozgarSetu AI helps job seekers find suitable government vacancies and local MSME opportunities through a simple, mobile-first experience. It competes on **trust and action**, not on the number of listings. Every vacancy carries its source link, dates and last-checked time. A rules-based engine explains eligibility in plain language, including **what is missing and what to do about it**. A tracker watches deadlines **and the notice itself** for changes. A language model only rewrites rule results in plain Bengali, Hindi or English; it never decides eligibility and never replaces the official notification.

The first version is deliberately small: a curated set of government recruitment notices and a few local MSME vacancies in one pilot area of West Bengal. Expansion depends on pilot evidence for listing accuracy, usability and real application progress.

1 Discover	2 Understand	3 Prepare & apply	4 Track
Find a source-checked vacancy	See what you meet, miss or must confirm	Gap guidance, document checklist, official link	Deadlines and notice-change alerts

Our big idea: a trust layer, not another job portal

Most digital job tools answer "what jobs exist?" Job seekers in rural and semi-urban West Bengal face a different problem: **which notices are real, do I qualify, am I missing a document, and did the deadline or rule change?** A wrong answer costs an application fee, a missed deadline, or a trip to a cyber cafe for nothing. RozgarSetu AI is built to give a **correct, explained and traceable** answer to that question, in the user's language, and to say "needs manual review" when it is not sure.

What makes it different

Principle	How RozgarSetu AI applies it
Rules decide, AI explains	Eligibility comes from auditable rules tied to a source notice. The language model only rewrites results in plain Bengali, Hindi or English and can be switched off.
Honest uncertainty	Four result states: Matched, Not met, Missing data, Needs manual review. The tool refuses to guess.
Action, not just information	Every result ends in a next step: a gap plan, a document checklist, the official link, a reminder.
Built for low confidence and low connectivity	Voice explanations, a one-screen profile, printable results and a community-helper mode.
Trust you can inspect	Every vacancy shows source, dates, last-checked time and only the checks actually completed. Accuracy is published with sample sizes and confidence intervals.

Six features that go beyond a standard job portal

Each is deterministic or human-checked where users act on it, and each is scoped so a small team can build or test it.

#	Feature	One-line value
1	Gap Coach ("Not yet" guidance)	A "Not met" result shows what would change it, such as the next age cut-off date or the qualification route the notice accepts.
2	Notice Watch	Saved jobs are rechecked; users are alerted if a deadline, rule or corrigendum changes.
3	Document Readiness Checklist	A per-notice list of documents, formats and validity rules, so users do not fail on paperwork.
4	Scam Shield	Rule-based red-flag checks on private listings, shown in plain language beside the verification badge.
5	Bengali, Hindi and English access, with voice	Full interface and explanations in Bengali, Hindi and English, plus audio and a minimal profile for users who find forms hard to read and type.
6	Eligibility Receipt + Sahayak mode	A printable or shareable result with notice version and date, plus a guided mode for community helpers.

About the Team

Name	Role	Skills / responsibility
Somnath Pal	[FILL IN: role, e.g. team lead]	[FILL IN: e.g. frontend, backend, data curation, user research]
[FILL IN: name]	[FILL IN: role]	[FILL IN: skills]
[FILL IN: name]	[FILL IN: role]	[FILL IN: skills]
[FILL IN: mentor / advisor, if any]	Mentor	[FILL IN: organisation and how they support the project]

Delete unused rows before submission. Name only people who have agreed to be named.

1. Problem and Location

Job seekers often find recruitment notices, local vacancies, apprenticeships and training information across disconnected sources. They may struggle to identify suitable opportunities, understand eligibility, track deadlines, or tell reliable listings from suspicious ones. Rural users may also face limited connectivity, language barriers and low confidence with digital services.

Where we observed it

Pilot location: [FILL IN: block / town / district in West Bengal]. Reason for choosing it: [FILL IN: one or two sentences, e.g. partner access, number of job seekers, presence of MSMEs].

What we found from users

We spoke with [FILL IN: number] job seekers and [FILL IN: number] MSME owners or managers in the area between [FILL IN: dates]. Key findings:

- [FILL IN: Finding 1: what they currently use to find vacancies, in their words or yours]
- [FILL IN: Finding 2: where it fails (missed deadline, unclear eligibility, suspicious offer, language, connectivity)]
- [FILL IN: Finding 3: what would make them trust a listing]
- [FILL IN: Finding 4: what MSMEs find hard about reaching candidates]

Report only what was actually said or observed. Do not include participants' names or personal details.

What published data shows

- **Youth unemployment:** India's Periodic Labour Force Survey for October–December 2025 reports unemployment of 12.6% in rural areas and 18% in urban areas for ages 15–29. These are national figures, not West Bengal figures [1].
- **Many very small employers:** as of 5 February 2024, 29,46,536 MSMEs, including informal micro enterprises, were registered on the Udyam and Udyam Assist portals in West Bengal, and 29,14,726 of them (about 99%) were micro enterprises [2]. Such employers rarely have a structured way to publish vacancies, which is why the plan uses a simple posting card.
- **Fraud risk:** in May 2025 Delhi Police reported a fake government-job racket that collected registration fees of ₹299–₹399 under a fake government body's name [3]. Telangana police reported 26,809 fake job scam cases from January 2024 to August 2025 [4]. These are examples from other places, not West Bengal data.
- **Existing state route:** West Bengal's Employment Bank asks job seekers to enrol online and then have the registration validated at an Employment Exchange [5].
- **Languages:** Bengali was the mother tongue of 86.22% of West Bengal's people in the 2011 Census [6]; the State government lists Hindi as the second most spoken language (2001 data) [7].

Existing routes and the gap (hypotheses to confirm in interviews)

Route users rely on today	What it does well	Gap RozgarSetu AI targets
Official recruitment notices and websites	Authoritative source for dates and rules	Spread across many bodies; long documents; no personal eligibility check, document checklist or change alerts
General job portals	Large number of listings, search tools	Not centred on local government notices or small local MSMEs; listing trust varies
Messaging groups, social media, word of mouth	Fast, local, familiar	Unverified; often no source link; fraud risk

Route users rely on today	What it does well	Gap RozgarSetu AI targets
National Career Service (NCS) portal	Free national portal for job search and matching, including central, state and private jobs; employer registration linked to Udyam, EPFO and ESIC; career counselling and job fairs [8]	Published descriptions do not mention a notice-level personal eligibility check, a document checklist or notice-change alerts (confirm on the live site)
West Bengal Employment Bank	State job portal with job seeker, employer and training modules; linked to Yuvasree training assistance [5]	Enrolment needs validation at an Employment Exchange; published descriptions do not mention notice-level eligibility checks or alerts (confirm on the live site)

The last two rows are based on published descriptions found in October 2026, not on tests of the live sites.

Users and scope

- Users: students, fresh graduates, rural and semi-urban applicants, and people seeking local work (pilot users aged 18 or above).
- Employer side: participating MSMEs that can provide a genuine vacancy and verifiable contact details.
- Scope: the pilot does not attempt to cover every recruiting body or all employment categories. The prototype covers one or two recruiting bodies and a small number of MSMEs, fixed during discovery.

2. Proposed Solution

One workflow: discover an opportunity → understand its requirements → prepare and open the official application source → track the next action and any change to the notice.

Core prototype (built first)

- **Source-checked Opportunity Finder.** Curated government notices and selected local MSME vacancies, each with source link, publication date, deadline and last-checked time. A badge lists only the checks actually completed.
- **Explainable Eligibility Assistant.** Compares entered details with structured requirements and shows matched criteria, unmet criteria, missing data, or a manual-review status.
- **Application Tracker with Notice Watch.** Save jobs, record progress and set reminders. Submission is not claimed unless the user confirms it.
- **Deadline reminders that reach people.** In-app first, plus SMS or WhatsApp-style deadline messages for users who consent.
- **Report a listing.** A one-tap report with reference number, and a minimal admin review queue so the full report-to-resolution loop can be demonstrated.
- **Accessible interface.** Mobile-first Bengali/Hindi/English design with a language switch on every screen, low-bandwidth pages, readable forms, icon-supported steps, and a Sahayak (helper) mode.

Second phase (after the core flow works)

- Full admin dashboard: source management, change history, complaint analytics and basic impact reporting.
- Spoken input and wider voice support in Bengali and Hindi beyond the prototype audio explanations, depending on pilot feedback.
- MSME Micro-Vacancy Card and trust ladder at larger scale (Section 4).

Deferred

Advanced interview coaching, broad training marketplaces, income forecasting, skills assessment, national coverage and complex career simulations. Salary data, when available, appears only as a sourced advertised range, not as a prediction of a user's income.

3. Innovation Features in Detail

Each feature below is designed to be testable in the pilot. None changes the central rule: users act on auditable rules and official sources, not on model guesses.

1 Gap Coach: "Not yet", with a path

What it does	When the result is "Not met", the tool shows *why* and *what could change it*, using only information in the notice: the next date the age limit would be satisfied or relaxed, the qualification routes the notice lists as equivalent, or the category relaxation the user has not entered.
Why it matters	A plain "you are not eligible" ends the journey. A gap plan keeps users informed about future cycles and next steps without promising an outcome.
How it is built	Extra fields in the rules schema (cut-off date, accepted equivalents, relaxation table). Pure rule output; the language model only rephrases it. Anything not stated in the notice returns "Needs manual review".

2 Notice Watch

What it does	Saved jobs are rechecked on the same schedule as listings. If the deadline, a requirement, or a corrigendum changes, the user gets an alert: "*This notice changed since you last checked. Review the update.*" Every eligibility result is stamped with the notice version and check date.
Why it matters	Silent changes to a deadline or rule are where a tracker does the most harm. This turns the tracker from a calendar into a safety net.
How it is built	Store a hash or version of each source page or PDF at each check; compare on recheck; reviewer confirms the change before the alert is marked verified. Uses permitted sources only.

3 Document Readiness Checklist

What it does	For each notice, a checklist of documents and formats the notice asks for (for example certificates, photo and signature specifications, proof of category or disability where relevant) and any validity or date rules, with a tick-off list the user can save.
Why it matters	Many rural applicants lose an application to missing or wrongly formatted paperwork, not to ineligibility. This is practical help that a job portal rarely gives.
How it is built	Curators capture a structured "documents" list from the notice during verification. No document upload is needed in the prototype, which also reduces privacy risk.

4 Scam Shield

What it does	A transparent red-flag check on private and MSME listings: asks for an upfront fee, uses only a personal messaging number, has no verifiable business detail, promises unusually high pay for no skills, or pushes urgency. Flags are shown in plain language beside the verification badge, and reports feed the review queue.
Why it matters	Fraud is a stated user fear. Showing *why* a listing looks risky teaches users to spot it themselves.
How it is built	Deterministic checklist applied by the curator and shown to the user; no automated blocking in the prototype. The badge still states only the checks completed and never claims a listing is safe.

5 Bengali, Hindi and English access, with voice

What it does	Users choose Bengali, Hindi or English on the first screen and can change it anywhere. Interface, eligibility explanations, document checklists and reminders appear in the chosen language, and the explanation can be played as audio. A minimal profile (a few taps with defaults) is available. Icon-based steps and large text support low literacy and low confidence.
Why it matters	Typing and reading long explanations is a barrier for the users the plan says it serves. Audio lowers it.
How it is built	Prototype: audio generated from the rule-checked explanation text using a text-to-speech service or the device's built-in speech support, subject to testing Bengali and Hindi audio quality on low-cost phones. Spoken input is a stretch goal, only if pilot feedback supports it.

6 Eligibility Receipt and Sahayak mode

What it does	A one-page result the user can print or share: matched and unmet criteria, notice link, notice version and date, and documents needed. Sahayak mode lets a trained community helper (for example a college volunteer or local centre) walk someone through the app, with the user's consent and without the helper keeping the user's data.
Why it matters	Many applicants rely on a cyber cafe or a helper. A receipt turns the result into something they can carry. It also gives partner organisations a role.
How it is built	Print-friendly result page with watermark "preliminary: verify against the official notice". Helper guide and a short consent script; helper sessions are budgeted and tested in the pilot.

What an eligibility result looks like

Status	Meaning	Illustrative example (not a real notice)
Matched	The entered detail satisfies the rule	Age 24; limit 30 on the cut-off date → met
Not met	The entered detail does not satisfy the rule	Required: graduate; entered: Higher Secondary → not met. Gap Coach shows the route the notice accepts, if any.
Missing data	A detail needed for the rule was not entered	Category not entered; relaxation cannot be applied
Needs manual review	The rule is ambiguous or conflicts with another source	Equivalent qualification clause needs reading of the full notice

4. Technology, Verification and Trust

A modular architecture that is affordable to prototype, testable and safe to expand. The final stack will follow the team's skills and deployment limits.

Layer	Approach
Frontend	React or Next.js; responsive progressive web app; Bengali/Hindi/English with Unicode fonts that render on low-cost phones; accessible forms; print-friendly result pages
Backend	FastAPI (Python) or Node.js REST API; input validation; role-based access
Database	PostgreSQL for users, vacancies, eligibility rules, document lists, source versions, reports and application tracking
Eligibility engine	Deterministic rule checks on structured requirements; explicit handling of missing or ambiguous data
AI assistance	Language model for bounded plain-language (Bengali, Hindi and English) explanations of rule results, grounded in stored vacancy data
Data operations	Admin-curated sources, permitted scheduled rechecks, version comparison for Notice Watch, expiry handling and change logs
Notifications	In-app reminders first; SMS or WhatsApp-style deadline messages for consenting users
Security	HTTPS, secure password hashing, least-privilege roles, suitable encryption, backups, audit logs, deletion workflow
Maps / location	Optional; added only if local discovery needs it

Why the AI is deliberately small

Eligibility is the part users act on, so it is decided by auditable rules, not by a language model. The model is used where it helps most: turning rule results and official wording into short, plain explanations in Bengali, Hindi or English. Core eligibility works even if the AI is switched off, and AI usage is capped.

Rules schema and reliability safeguards

- Each rule stores its source URL and version/date, the age cut-off date, category-wise relaxations, accepted equivalent qualifications, required documents, and a flag for amendments or corrigenda.
- A language model never decides eligibility from free text. Where a rule is ambiguous or profile data is missing, the result is "Needs manual review".
- Every result shows the reason for each rule and links to the full official notification.
- Explanations are tested against the rule output so the text cannot contradict it, including Bengali and Hindi output, and unusual text inside vacancy descriptions. Bengali and Hindi templates are reviewed by native speakers before use.
- The test set is built from human-reviewed cases (age limits, category relaxations, equivalent qualifications), checked by two reviewers who did not write the rules; failures are published.

Vacancy verification

- Government listings link to the official recruiting body's notice or application page whenever possible.
- Record source, publication date, deadline, last-checked date and status for every vacancy.
- Recheck active listings at a defined interval, daily where feasible, and flag unavailable or conflicting sources.
- Human reviewers resolve uncertain dates, eligibility rules and high-risk complaints before a listing is marked verified.
- Expired vacancies leave active results; correction history is kept. Authorized APIs are used where available; otherwise permitted manual curation consistent with each source's terms.

MSME Micro-Vacancy Card and trust ladder

Small employers often hire informally and may not publish structured vacancies. To lower the barrier, an MSME describes a vacancy in a short guided form (about a minute: role, location, pay range, skills, how to contact, how long it stays open), completed with a community partner's help where needed. Each card then shows a trust level based on checks actually completed:

Level	Checks completed	What the card says
Basic	Contact number called back and vacancy details confirmed	"Contact verified on [date]"

Level	Checks completed	What the card says
Documented	Plus a business-registration or identity document seen	"Business document seen on [date]"
Referred	Plus a reference or confirmation from a local partner organisation	"Confirmed by [partner] on [date]"

Start with very few MSMEs and grow only as reviewer capacity allows. The badge states only the checks completed; it cannot guarantee that fraud is impossible. Before building further, the pilot tests the assumption that MSMEs will post at all, and why.

Complaint handling and review roles

Each report receives a reference number and status. An administrator records evidence, reviews the source or employer, may temporarily suspend a high-risk listing, documents the decision, and provides a route for correction or appeal.

Target (proposed, to be tested in the pilot)	Value
Acknowledge a report	Within 24 hours
Triage a high-risk report	Within 48 hours
Decision on a high-risk listing	Needs a second reviewer

Reviewers and administrators work on a named rota, drawn from the team and, where agreed, partner colleges or community organisations.

5. Implementation Plan

Workstream	Who	Depends on
Discovery: interviews, area choice, source inventory, data schema, time five real notices to measure curation hours	Team with community partner(s)	None
Platform: profiles, search, listing pages, database, admin roles	Team	Approved data schema (no rule coding before the schema is approved)
Eligibility: structured requirements, rules, Gap Coach, document lists, explanations, test set	Team plus two independent reviewers	Schema and source notices from discovery
Tracking and Notice Watch, reminders, report queue, Bengali/Hindi/English UI, audio explanations, privacy controls	Team plus review rota	Core platform
Audit, usability testing, prototype hardening	Team plus reviewers and test users	Eligibility and trust features
Pilot	Team, community partner(s), consented users and MSMEs, trained helpers	Audit passed; privacy and access-control checks passed

Source inventory

During discovery the team records, for every recruiting body or source used: URL, format (web page, PDF, API), update frequency and permitted use. Authorized APIs are used where available; otherwise permitted manual curation or methods consistent with each source's terms.

Minimum viable cut if time runs short

Scope is cut first, not quality. The named minimum is: **one recruiting body, one pilot area, a small set of audited vacancies, plus eligibility, document checklist, tracker with Notice Watch and the report-a-listing loop.** MSME cards, audio explanations and Sahayak sessions are tested at smaller scale or moved to the second phase. Bengali and Hindi text support is **not** cut, because it is a requirement of the plan; if capacity is short, the number of notices is reduced instead.

6. Privacy and Data

Data	Why it is needed	Required?
Name, mobile number or email	Account and reminders	Required
Date of birth or age	Age-limit checks	Required for eligibility
Highest qualification and stream	Qualification checks	Required for eligibility

Data	Why it is needed	Required?
Social category	Category relaxations	Optional; without it, relaxation rules return "Needs manual review"
Disability status	Relevant relaxations	Optional; same effect as above
Preferred district or area	Local filtering	Optional
Saved jobs, application status	Tracker and Notice Watch	User-controlled

- **No-account eligibility check** : a user can run a check without creating an account; the entered details are not stored after the session.
- Only necessary information is collected. Data is deleted on the user's request; retention periods are fixed in the privacy review before any public pilot.
- Consent text is written in Bengali, Hindi and English, with a breach-response plan. Helpers do not keep user data.
- The design follows India's Digital Personal Data Protection Act, 2023. The Rules were notified in November 2025 and the main duties (notice, consent, security safeguards, breach reporting) apply from about May 2027 [10]; the pilot is designed to meet them from the start and is reviewed before public use. Pilot users are aged 18 or above.
- Applicant data is never sold or shared for marketing.

7. Cost, Funding and Sustainability

Planning estimates for a small student-led prototype and pilot. They are not supplier quotations or committed funding.

Cost item	Base case	Assumption
Domain and deployment	₹5,000	One domain and small hosting plan
Database, backups, monitoring	₹6,000	Small managed database; free tiers may cover the demo
AI/API usage (explanations and audio)	₹8,000	Hard usage cap; core eligibility works without AI
Testing and accessibility	₹6,000	Device/data costs and usability sessions
Translation review (Bengali, Hindi)	₹3,000	Native-speaker review of interface text and rule-explanation templates; rate to be confirmed
Vacancy curation and pilot operations	₹12,000	About 50 audited records, one pilot area, local travel and verification calls
SMS reminders (including DLT registration)	₹7,000	Commercial SMS in India needs DLT registration of sender, header and templates (about ₹5,900 one-time per vendor sources) plus about ₹0.10–0.18 per message; a provider's pre-approved route may avoid separate registration. To be confirmed [9]
Helper sessions and printed guides	₹4,000	Training and materials for community helpers; small pilot
Contingency	₹5,000	Unexpected hosting or integration costs
Total	**₹56,000**	Excludes the market value of unpaid team time

Figures are planning estimates and are revalidated once providers and partners are confirmed.

Public-pilot operating cost

A public pilot needs its own operating budget for support, security review, data maintenance and incident handling. The largest part will be reviewer hours for curation and verification. The team will measure hours per notice during discovery and the prototype and size this budget from those measurements. Prototype-level funding is not presented as enough for nationwide service.

Funding sources

- Student innovation challenge grants and prototype support; college incubation or entrepreneurship-cell support.
- CSR or local foundations focused on digital inclusion and livelihoods.
- Partnerships with colleges, training centres and MSME associations, without selling or misusing applicant data.

Sustainability after the pilot

- Institutional support: colleges, training centres or MSME associations that fund or staff curation for their own communities.
- Adoption pathway: the challenge's pilot-and-adoption route with institutions or departments.
- Possible clearly labelled, verified training or apprenticeship listings. Applicant data is never part of any revenue model.
- **Neutrality rule** : payment or sponsorship never raises a listing's ranking or earns a verification badge. Sponsored content, if ever allowed, is labelled and separate.

8. Beneficiaries

Beneficiary	Potential benefit
Students and fresh graduates	Find suitable entry-level roles, see what is missing, and understand application requirements
Rural and semi-urban job seekers	A lighter, local-language, audio-supported route to opportunity information
Government job applicants	Source-linked notices, criteria review, document checklists, deadline tracking and change alerts
Local MSMEs	Publish a vacancy quickly in a structured form and reach candidates with relevant skills
Colleges and training centres	Share trusted information and review aggregate, privacy-conscious outcomes
Community organisations and helpers	A clear role in guiding users and giving accessibility feedback

Estimated pilot reach: [FILL IN: number of job seekers and MSMEs, with the source, e.g. students enrolled at the partner college or members of the partner association]. This is an estimate for the pilot area, not a count of users. Potential partners are not represented as confirmed unless they have explicitly agreed to take part.

9. Timeline

Weeks	Milestone	Deliverable
1–2	Discovery and data design	User interviews, MSME posting test, pilot area, source inventory, data schema, verification checklist, curation time for five real notices
3–4	Core platform	Profile, job search, listing pages, database, admin roles
5–6	Eligibility and tracking	Rules-based eligibility, Gap Coach, document checklist, explanations, official links, saved jobs, deadline tracker
7–8	Trust and accessibility	Notice Watch, reporting and review queue, reminders, privacy controls, Bengali/Hindi/English UI, native-speaker review of translated text, audio explanations, low-bandwidth pages
9–10	Working prototype	Vacancy audit, eligibility test-set run, usability and device testing, issue fixes, prototype report
11–18	Pilot with consented users and MSMEs	Task-completion data, listing audits, helper-mode sessions, feedback, pilot report, expand / revise / pause decision
After the pilot	Outcome follow-up	Consent-based follow-up on interviews and job starts, timed to hiring cycles

This is a target schedule for a small team, not a guarantee. Public release is delayed if source verification, privacy review or eligibility accuracy is not ready. If time runs short, scope is cut first (Section 5), not quality.

10. Expected Impact and Evaluation

The intended impact is to reduce the effort and confusion involved in finding suitable work and to help users take better-informed application steps. Employment gains must be demonstrated, not assumed.

Measure	How it will be measured
Effort saved	Time for a test user to find a relevant vacancy, compared with the user's usual method on the same task
Understanding	Share of users who correctly state why they do or do not meet a criterion, and who identify the official application link

Measure	How it will be measured
Preparedness	Share of test users who correctly list the documents needed for a notice, with and without the checklist
Usability	Task completion, error rate and a standard usability questionnaire, including on low-cost devices and slow networks, reported separately for each language
Language parity	Share of test users in Bengali and in Hindi who correctly state their result; reviewer check that translated explanations match the rule output; text and audio rendering on low-cost phones
Vacancy freshness	Share of active listings checked within the defined review interval
Listing accuracy	Independent audit of source, dates, status and key requirements, reported with confidence intervals
Eligibility reliability	Against human-reviewed cases: share resolved automatically (coverage), wrongly-"Matched" rate, wrongly-"Not met" rate; manual-review cases reported separately
Notice Watch	Changes detected in test notices against changes found by a reviewer; alert delivery time
Application progress	Saved jobs, outbound clicks and user-confirmed submissions, reported separately
Trust and safety	Complaint volume, time to triage and resolve, repeat issues
Interview and job outcomes	Consent-based follow-up, with evidence type and response rate; reported as a later follow-up, not a pilot result

Proposed pilot targets (revised)

- Audit at least 50 vacancy records if they can be reliably curated (more if reviewer time allows); use fewer rather than lower the standard.
- Aim for at least 95% accuracy on audited critical vacancy fields (source, deadline, active/expired status). **Report the result with its 95% confidence interval and sample size.** With 50 records, even a perfect result has a lower bound of about 93%, so the interval, not the point figure alone, is the honest claim.
- Aim for at least 90% agreement on a human-reviewed eligibility test set, **with the test-set size stated in advance** (planning figure: at least 60 cases, to be confirmed), and with the wrongly-"Matched" rate reported separately because that error is the most costly to users.
- Gather feedback from a small group of job seekers and participating MSMEs; sample size is set once recruitment feasibility is known.

These are targets, not achieved results. Sample sizes, test methods and failures are published.

11. Scalability

- **Geography:** start in the pilot area; add districts only when sources and support are reliable. Bihar and Jharkhand, which are in the same challenge region, are possible later states. Because Hindi is already supported, the main work there is local sources and partners; regional wording still needs checking. This is a hypothesis.
- **Languages:** Bengali, Hindi and English from the start; others added on user evidence and reviewed translations. Hindi is the second most spoken language in West Bengal [7]. Source notices are often in English or the recruiting body's language, so each notice's rule summary is translated and reviewed once, then reused.
- **Technology:** modular APIs and structured vacancy and document schemas allow new sources and categories without rebuilding the core.
- **Supply and demand:** seed the platform with a small number of verified MSMEs first, then bring in candidates through the same partners.
- **Running cost:** each new area adds curation, review and support work, planned with the operating budget in Section 7.
- **Responsible AI:** new AI uses are evaluated separately; eligibility decisions stay auditable and rules-based.

Expansion gate

A new district or state is added only after the existing pilot meets all of the following:

- At least 95% accuracy on audited critical vacancy fields and at least 90% agreement on the eligibility test set (Section 10), with the intervals reported.
- No unresolved critical security, privacy or access-control issue.
- Complaint acknowledgement and triage targets (Section 4) met.

- Usability results acceptable on low-cost devices and weak networks, and support load per user judged manageable by the team and partners.

12. Prototype and Pilot Evidence

Minimum working demonstration (about three minutes)

- A job seeker opens the app and creates a basic profile with only necessary information, or uses the no-account check.
- The user searches a curated set of government and local MSME opportunities. A vacancy page shows source, deadline, last-checked date and verification status.
- The eligibility engine shows matched requirements, missing data, and a "Not met" result with Gap Coach guidance. The user switches between Bengali, Hindi and English and the audio explanation plays in the chosen language.
- The user sees the document checklist, opens the official application source, saves the job and sets a reminder.
- A test notice is changed by the team; **Notice Watch alerts the user** and the result is re-stamped with the new version.
- The user reports a suspicious listing; Scam Shield flags are visible; an administrator reviews it and records the outcome.

Pilot design

Recruit a small, consented group of job seekers and a manageable number of genuine MSME participants through confirmed community or educational contacts. Test finding a vacancy, interpreting eligibility, identifying the official application link, listing needed documents and setting reminders, including with a helper in Sahayak mode. Record task completion, errors, feedback and listing-audit results. Participants' personal data is not published.

Evidence attached to this application

Item	Status
Screenshots or clickable prototype of the core flow	[FILL IN: attached / in progress / not yet]
Sample of source-checked vacancy records	[FILL IN: number attached]
Hand-checked eligibility test cases and results	[FILL IN: number and agreement]
Curation time per notice from five real notices	[FILL IN: hours per notice]
Interview notes or summary (no personal details)	[FILL IN: attached / not yet]
Letter of intent from a college, NGO or MSME association	[FILL IN: attached / not yet]

Acceptance criteria for public pilot use

- Every active vacancy has source and freshness metadata.
- Eligibility results explain each evaluated rule and return manual review when uncertain.
- Application tracking does not imply that the platform submitted an application for the user.
- Administrators can review reports and maintain an audit trail.
- Critical privacy, access-control and usability checks pass first.

Intellectual Property and Responsible Use

- All content, data and supporting material in this application is owned by the team or used with permission.
- No real applicants' personal data is included in the submission.
- Official notices are linked and described, not copied wholesale.

Conclusion

RozgarSetu AI aims to make job discovery more trustworthy and actionable by connecting reliable vacancy sources, transparent eligibility guidance, practical preparation help, change alerts and measurable user outcomes in one accessible workflow.

“RozgarSetu AI helps people discover suitable jobs, understand why they may qualify, know what is missing, and take the next step with confidence, starting with source-checked opportunities in West Bengal.”

Important limitations. Eligibility guidance is preliminary and must be checked against the complete official recruitment notification. Vacancy status can change after review. Verification reduces risk but cannot guarantee that a listing is safe. Budget and timeline are estimates to validate before launch.
